

General Overview

The Tire Pressure Monitoring Systems (TPMS) is a **universal fit** product that allows for constant Monitoring of a vehicle's Tire Pressure & Temperature. The system can receive wireless information from up to 22 wheels or 4 wheels. After programming the ideal psi for each tire into the monitor, a transmitter is attached to each wheel's valve stem in sequence. Various Levels of warnings are issued for pressure changes (under & over), high temperatures and low battery status.

We realize most people rarely read instructions. At the same time, this is a highly sophisticated product which requires unique programming. If you don't read at least the basic set up instructions, you will either return the product or have to call us. As we really don't want you to return the product to your retailer, PLEASE READ the instructions. If you still need help, check our web site, e-mail or call us. We have done our best to make these instructions easy to follow and occasionally entertaining. Life is too short to be serious all the time – right?

The monitor/receiver comes charged so you can start programming immediately. It is also set up to measure tire pressure in psi and temperature in Fahrenheit (°F). However if you live in Canada or Great Britain or Mexico, you are probably still trying to figure out which system you want to use. Whatever you decide, the TPMS can be modified to your preferences.
